Shaken Baby Syndrome Prevention Training & Sudden Infant Death Syndrome

Shaken Baby Syndrome (SBS) is a severe form of brain injury that occurs when an infant or young child is shaken forcibly enough to cause the brain to rebound against his or her skull. At least one baby is shaken every week in Wisconsin. According to the national Shaken Baby Alliance, 25% of shaken babies die. Shaken Baby Syndrome is tragic, but it is also preventable. By providing information to parents and other caregivers on the dangers of shaking babies and alternate ways to cope with an infant’s crying, the incidence of Shaken Baby Syndrome can be reduced.

Sudden Infant Death Syndrome (SIDS) is a syndrome marked by the sudden death of an infant that is unexpected by history and remains unexplained after a thorough forensic autopsy and a detailed death scene investigation.

**Upon completion of this training the participant will:**

1. Understand the current recommendations on infant safe sleep practices.
2. Understand the barriers to following safe sleep recommendations.
3. Be aware of techniques for parents to use to help their children regulate their sleep/wake cycle.

**The following training has been scheduled:**
